

Prompt: How do i explain my project to interviewer?

Answer:

This is one of the **most important preparation areas** for CDAC placements.

Many candidates build a project, but when asked **"Explain your project"**, they either:

- Describe every feature (too much),
- Read the resume (boring), or
- Explain code (too technical too early).

A good explanation is actually a **story**.

The 2-Minute Project Pitch

If an interviewer asks:

"Tell me about your project."

You should answer like this:

My project is LearnHub, a learner-focused content platform that enables creators to publish and monetize educational resources such as PDF notes and articles. Learners can discover resources through a marketplace, purchase premium content, and access it using an integrated content viewer.

The motivation behind the project was that educational resources are scattered across multiple platforms, and independent educators often lack a dedicated platform to distribute and monetize their content while directly interacting with learners. LearnHub addresses this by combining content publishing, a marketplace, secure payments, and creator–learner interaction into a single platform.

We developed the frontend using React and the backend using Spring Boot with Spring Security, Spring Data JPA, and RESTful APIs. PostgreSQL is used as the database. The application follows a layered architecture with JWT-based authentication for secure access.

One of the key features is the creator monetization workflow, where creators can publish premium resources, learners can purchase them, and access is automatically granted after successful payment. We also implemented 1:1 mentorship session booking to encourage direct interaction between creators and learners.

Stop there.

Most interviewers will interrupt and ask questions.

The Structure You Should Follow

Always remember this order:

1. What is the project?
2. Why did you build it?
3. Who uses it?
4. Main features
5. Tech stack
6. Your contribution

Never start with

"Frontend React... backend Spring Boot..."

They didn't ask your tech stack first.

If They Ask "What Problem Does It Solve?"

Say:

Existing educational resources are distributed across multiple platforms, making it difficult for learners to discover quality content in one place. At the same time, independent creators have limited options to monetize their educational material and engage directly with learners. LearnHub provides a single platform where creators can publish content, earn revenue, and interact with learners through mentorship, while learners can easily discover, purchase, and access educational resources.

This sounds like an engineer thinking about a product.

If They Ask "What Features Have You Implemented?"

Don't list 20 features.

Mention only the important ones.

- Secure Authentication
 - Marketplace
 - PDF & Article Publishing
 - Digital Purchase
 - Content Viewer
 - Creator Dashboard
 - Learner Dashboard
 - 1:1 Mentorship
 - Admin Panel
-

If They Ask "Why Spring Boot?"

Good answer:

We chose Spring Boot because it simplifies REST API development, provides built-in dependency injection, integrates well with Spring Security and JPA, and allows us to build a scalable backend with minimal configuration.

If They Ask "Why PostgreSQL?"

You can now answer:

We selected PostgreSQL because it integrates well with Supabase, allowing the entire team to collaborate using a shared cloud database. Since the project uses Spring Data JPA, switching between relational databases requires minimal changes, making PostgreSQL a practical choice for development.

If They Ask "What Was Your Contribution?"

This question is asked in almost every team project interview.

Be specific.

Example:

My primary contribution was backend development. I designed the database schema, implemented authentication using Spring Security and JWT, developed REST APIs for user management, content publishing, and marketplace functionality, and integrated the frontend with these APIs. I also collaborated on designing the overall application architecture.

Only claim work you actually did.

If They Ask "What Was the Most Challenging Part?"

A good answer:

The most challenging part was designing the purchase and access workflow. We needed to ensure that only users who successfully purchased a premium resource could access it while keeping the implementation secure and maintainable. We solved this by validating ownership on the backend before serving protected content.

What Impresses Interviewers Most

Interviewers usually don't care if you have 15 or 25 features.

They care whether you understand:

- Why the project exists
- System architecture
- Database design
- Authentication
- API design
- Deployment approach
- Challenges and trade-offs

If you can explain those clearly, your project will stand out more than one with many superficial features.

My recommendation

As your project progresses, prepare these **10 interview topics** for LearnHub:

1. **2-minute project overview.**
2. **High-level architecture.**
3. **Database schema and relationships.**
4. **Authentication and authorization flow.**
5. **End-to-end purchase workflow.**
6. **REST API design.**
7. **Spring Security + JWT implementation.**
8. **Why React + Spring Boot + PostgreSQL.**
9. **Your personal contributions.**
10. **Challenges faced and how you solved them.**

If you can confidently answer these, you'll be well prepared for most CDAC CCPP project discussions.
